County groups used for prevalence estimates of BRFSS responses on kentuckyhealthfacts.org

These county groups were created to reflect regions with similar demographic and socioeconomic characteristics. County-level indicators considered in the regionalization algorithm included percent of adults with a high school diploma, percent living below poverty, percent age 65 or older, percent black or African-American, and rural-urban continuum code. These data were obtained from the 2010 U.S. Census or 2006-2011 American Community Survey.
